

Participating in an exchange program at Seoul National University in South Korea would be a valuable opportunity for my academic and personal growth. Studying abroad offers the ideal setting to pursue my interests in artificial intelligence and global research, allowing me to combine academic insights with cultural immersion. While I haven't lived in South Korea, I've engaged with its culture through media and conversations with international students. Through these connections, I've developed a strong admiration for core Korean values, particularly the emphasis on respect, discipline, and dedication to education.

I recognize that studying in South Korea will bring a meaningful period of adjustment, especially within its dynamic academic and research culture. I am eager to adapt to new teaching approaches, collaborative laboratory environments, and the professional communication styles between students and professors, viewing these differences as opportunities to challenge myself and grow. Beyond academics, living in a vibrant city like Seoul will expose me to new languages, customs, food, and social norms that will expand my perspective and deepen my cultural understanding. Although moments of homesickness or stress may arise, I see these experiences not as obstacles, but as valuable steps toward greater resilience, independence, and personal development.

My approach to adaptation is stepping beyond my comfort zone through direct experience. I'm currently practicing basic Korean, mostly so I can test out my clumsy language skills and learn the real culture through small, everyday conversations with my international peers. I want to put myself out there, whether that means joining student clubs, making friends from all over, or trying every new local food I can find. I plan to carry that same curiosity and open-mindedness into the lab at Seoul National University. I'm ready to exchange ideas, see how people from different backgrounds approach AI, and share my own ideas to become a true part of the team.

I expect this exchange experience to help me become more independent, globally aware, and confident in cross-cultural communication while expanding my understanding of artificial intelligence and international education. I hope to apply the knowledge and experiences I gain to my future academic and career goals, and I am confident that studying at Seoul National University will be a meaningful and valuable opportunity for my development.
